## Infrastructure Tuning Boost

A service from Forability Ltd can help eliminate 15%-35% of your business' IT Infrastructure expenses

Organisations need fast and reliable IT systems. These systems run on an invisible IT infrastructure of servers, data storage units and network devices, residing in internal Data Centres or 'hosted' in the Cloud by companies like Amazon, Microsoft, Google and many others. The initial investment in owned IT Infrastructure is high and there are running costs. For using the Cloud clients pay monthly and these fees may be significant, running into the millions of Euros a year for large corporations.

In most cases the IT infrastructure of an organisation hides significant slack, meaning that through rearrangement some servers and storage units can be removed leading to an opportunity for sizable reduction of cost. The slack is there for many reasons including the logical reserves for business peaks, the lack of internal expertise to find a more economical setup, and the natural missing motivation of the hardware seller and the Cloud provider to help in the act of reduction of their own revenue.

But the reality is that reducing IT infrastructure slack is complex as it requires a very good understanding of systems performance and what minimal IT infrastructure is needed for the speed and reliability organisations desire from their systems. Only having understood the systems performance can one safely proceed in identifying and removing IT Infrastructure slack. The process requires multi-varied technical expertise, automation tools and experience.

Having specialised for years in systems design, installation and maintenance coupled with our R&D in automation of systems management, Forability is one of few providers positioned to carry out the process safely and to the best effect.

By use of our proprietary technology Forability collects extensive data about systems performance and usage of Infrastructure that becomes the basis of a fact-backed plan for rearrangement of IT infrastructure and reduction of cost. Forability is technology and provider neutral, placing the customer interest at the core of the engagement. And with our long experience in similar projects we deliver results with a standard and transparent methodology in an industry leading 4-7 weeks.

Our service charge is only applicable after tangible savings are realised and relates to the time and effort of our work – not the realised benefits, which normally are much greater and long lasting.
